XhoI; The cDNA library was constructed from mRNA isolated from very young seeds (less than 20mgs). The library was prepared using the Stratagene pBluescript II SK (+) library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with an Xho I restriction site. Eco RI adaptors were ligated to the blunt-ended cDNA fragments followed by Xho I digestion. The cDNA insert is protected from Xho I digestion via methylation during first strand cDNA sythesis. The cDNA fragments were directionally cloned into the Eco RI-Xho Irestriction site of the pBluescript vector. The ligated cDNA fragments were pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cell. The library was constructed by Anu Khanna (Lila Vodkin lab, University of Illinois)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Shoemaker R/Public Soybean

//dev stage="12 and 14 DAE"
//dev stage="12 and 14 DAE"
//clone lib="-p proteoid root (cluster root); Vector:
//note="Organ: -p proteoid root (cluster root); Vector:
pBLUESCRIPT SK(+/-); Site 1: EcoRI; Site 2: KhoI; Proteoid
roots of white lupin grown under p deficient conditions
were harvested 12 and 14 DAE (days after emergence); and
poly(A)+ RNA was isolated. The poly(A)+ RNA obtained from
plants 12 and 14 DAE was combined in a 1:1 ratio and 7 ug
total RNA was used for reconstruction of a proteoid root
cDNA library in the phage ZAPII vector according to the
manufacturer's instructions (Stratagene, La Jolla, CA, USA
). For conversion of the phage library into the plasmid
form, mass excision was performed according to the
procedure described by Stratagene."
